INTRODUCTION

Introduction: - This website is developed for **User Travelling Purpose for all location**. The website is developed in **JAVA** language. The most popular technology of java like **JSP** (Java Server Pages) and **Servlet** are also used in this website. This website is fully designed in **MVC** (Model View Controller) pattern. The website view is most interactive and user friendly, so to work for this website is very easy.

Now a days Person interacts with any location and choose the destination are organised through their website, so this website is very helpful for the any person. In the website student can know about the how location set, online booking and lot of things through this website. Here students can also fill their sign-up form then after fill login form and book their cabs.

SYSTEM ANALYSIS

System analysis is a process of gathering and interpreting facts, diagnosing problems and the information to recommend improvements on the system. It is a problem-solving activity that requires intensive communication between the system users and system developers. System analysis or study is an important phase of any system development process. The system is studied to the minutest detail and analyzed. The system analyst plays the role of the interrogator and dwells deep into the working of the present system. The system is viewed as a whole and the input to the system are identified. The outputs from the organizations are traced to the various processes. System analysis is concerned with becoming aware of the problem, identifying the relevant and decisional variables, analyzing and synthesizing the various factors and determining an optimal or at least a satisfactory solution or program of action.

A detailed study of the process must be made by various techniques like interviews, questionnaires etc. The data collected by these sources must be scrutinized to arrive to a conclusion. The conclusion is an understanding of how the system functions. This system is called the existing system. Now the existing system is subjected to close study and problem areas are identified. The designer now functions as a problem solver and tries to sort out the difficulties that the enterprise faces. The solutions are given as proposals. The proposal is then weighed with the existing system analytically and the best one is selected. The proposal is presented to the user for an endorsement by the user. The proposal is reviewed on user request and suitable changes are made. This is loop that ends as soon as the user is satisfied with proposal.

Preliminary study is the process of gathering and interpreting facts, using the information for further studies on the system. Preliminary study is problem solving activity that requires intensive communication between the system users and system developers. It does various feasibility studies. In these studies, a rough figure of the system activities can be obtained, from which the decision about the strategies to be followed for effective system study and analysis can be taken.

Here in the Email to Fax server project, a detailed study of existing system is carried along with all the steps in system analysis. An idea for creating a better project was carried and the next steps were followed.

◆ **Proposed System**

The aim of proposed system is to develop a system of improved facilities. The proposed system can overcome all the limitations of the existing system. The system provides proper security and reduces the manual work. The existing system has several disadvantages and many more difficulties to work well. The proposed system tries to eliminate or reduce these difficulties up to some extent. The proposed system will help the user to reduce the workload and mental conflict. The proposed system helps the user to work user friendly and he can easily do his jobs without time lagging.

Expected Advantages of Proposed System

The system is very simple in design and to implement. The system requires very low system resources and the system will work in almost all configurations. It has got following features:

- Fully works as a online
- Reducing the time ⌘
- Centralized maintain all information.
- Easy to Understanding the information.
- Easy to managing whole Information
- Fast and easy to use ⌘ User friendly
- Easy to managing whole response, Mail

♦ **Aim of the Software**

This software is developed to help computer science students to learn about the Web application designing using JSP and HTML from their basic capabilities to build a complete working application. Further, it gives insight about how GUI interacts with server-side language, Java, and finally with the MYSQL database.

FEASIBILITY STUDY

♦ **TECHNICAL FEASIBILITY:**

Evaluating the technical feasibility is the trickiest part of a feasibility study. This is because, at this point in time, not too many detailed designs of the system, making it difficult to access issues like performance, costs on (on account of the kind of technology to be deployed) etc. A number of issues have to be considered while doing technical Analysis.

a) Understand the different technologies involved in the proposed system:

Before commencing the project, we have to be very clear about what are the technologies that are to be required for the development of the new system.

b) Find out whether the organization currently possesses the required technologies:

- o Is the required technology available with the organization?
- o If so is the capacity sufficient?

For instance-

“Will the current printer be able to handle the new reports and forms Required for the new system?”

♦ **OPERATIONAL FEASIBILITY:**

Proposed project is beneficial only if it can be turned into information systems that will meet the organizations operations requirements. Simply stated, this test of feasibility asks if the system

will work when it is developed and installed. Are there major barriers to Implementation?

Here are questions that will help test the operational feasibility of a project:

Is there sufficient support for the project from management from users? If the project from management from users? If the current system is well liked and used to the extent that persons will not be able to see reasons for change, there may be resistance.

Are the current business methods acceptable to the user? If they are not, Users may welcome a change that will bring about a more operational and useful system.

Have the user been involved in the planning and development of the project?

Early involvement reduces the chances of resistance of the system and in general and increases the likelihood of successful project.

Since the proposed system was to help reduce the hardships encountered. In the existing manual system, the new system was considered to be operational feasible.

◆ **ECONOMICAL FEASIBILITY:**

Economical feasibility attempts to weigh the costs of developing and implementing a new system, against the benefits that would accrue from having the new system in place.

This feasibility study gives the top management the economic justification for the new system.

A simple economic analysis which the actual comparison of costs and benefits are much more meaningful in this case. In addition, this proves to be useful point of reference to compare actual costs as the project

progresses. There could be various types of intangible benefits on accounts of automation. These could include increased customer satisfaction, improvement in product quality better decision-making timeliness of information, expediting activities, improved accuracy of operations, better's documentation and record keeping, faster retrieval of information, better employee morale

SYSTEM REQUIREMENT SPECIFICATION

Overview:

Looking for this website of user travel system to manage the User details, user location etc.

- Secure online user details data fill up .
- User can able to signup it self.
- User can know all details about name, mobile number, wallet see all right details.
- Admin can manage all details of this website.
- Contact page help the user to contact the travel department.

MODULES DESCRIPTION

Number Of Modules:

The system after careful analysis has been identified to be presented with the following modules:

The modules involved are:

- 1. Company**
 - i. About Us**
 - ii. Careers**
 - iii. Contact Us**
- 2. Features**
- 3. Support**
- 4. Sign Up**
- 5. Login**
- 6. Book Now**

Description For Modules:

1. Company:

Any interested User can visit the Company page to see all the features of website. It will be the first page of the website. Here user visit the website and know about the cabs booking like A car for every occasion, Why Ride with Travel, Download the app facility and so on.

I. About Us:

Person can visit this to know about those people. Who are working on his website as well as founder and co-founder of this website and his qualification.

II. Careers:

III. Contact Us:

From this we can contact the institute for further details and for further Enquiry

2.Features:

In this website there are many features are given According to the needed of the Peoples. Like: - 1.) 24/7 hours services, 2.) Free Wi-Fi 3.) Top rated Deriver 4.) Cashless Ride 5.) Cabs on every pocket (It means everyone can book the cabs for travelling whenever he wants.).

3.Support:

In this one more feature is given and that is Customer support. Peoples can ask anything at a anytime. If any problem arrived like 1.) About make Payment 2.) About Safety 3.) Sing up (if any problem arrives during the doing a sing up), 4.) A guide to travel 5.) Help with a trip, etc.

4.Sign Up:

Through this people can sign up and register themselves to the book a cab.

5.Login:

People can login themselves to see their current status. Here people visit the website and know about department like See Profile details, All rides details, Wallets and so on.

6.Book Now:

User can book a cab from easy way as well as from any locations.

PROCESS FLOW

The model 2 architecture for designing JSP pages is in reality, Model View Controller (MVC) applied to web applications. Hence the two terms can be used interchangeably in the web world. MVC originated in small talk and has since made its way into java community. Model 2 architecture and its derivatives are the corner stones for all serious and industrial strength web applications designed in the real world. Hence it is essential for us understand this paradigm thoroughly

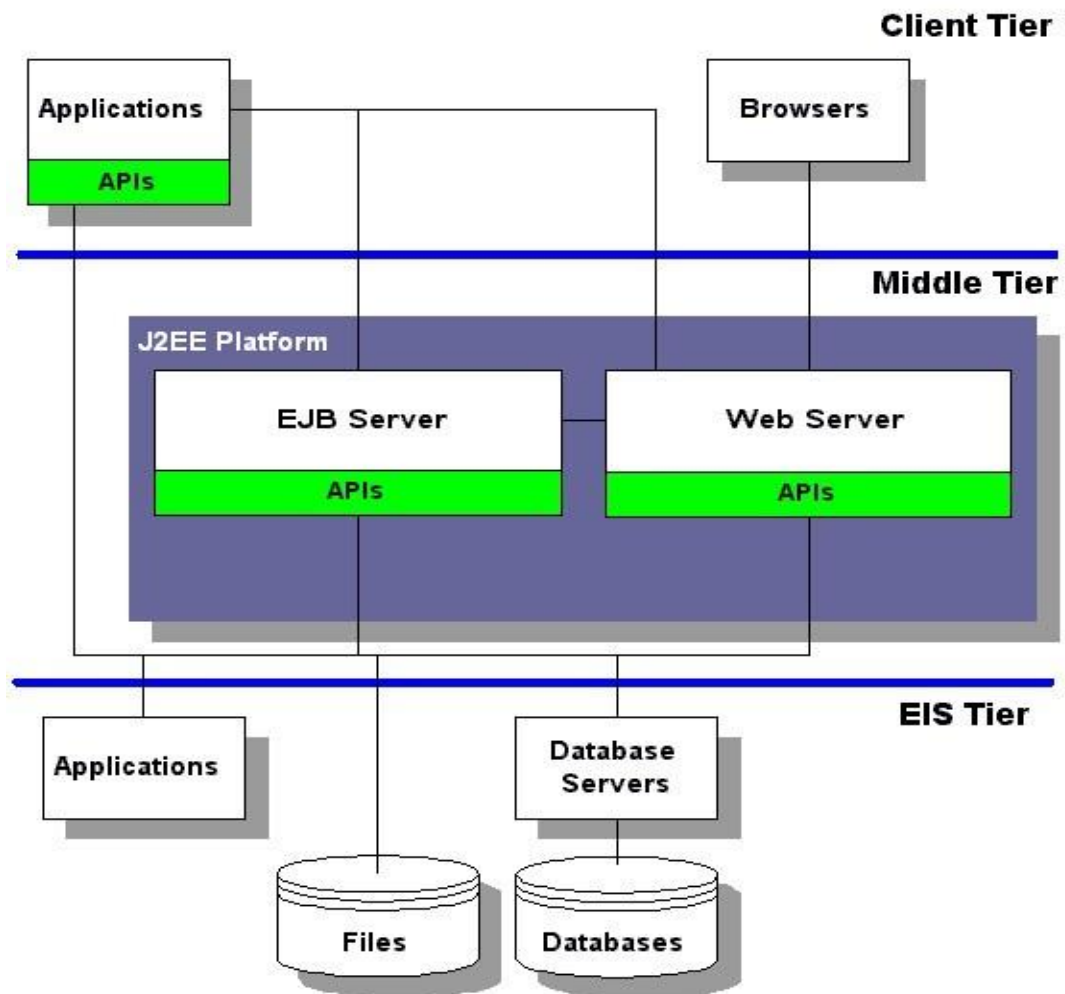

The main difference between **Model 1** and **Model 2** is that in Model 2, a controller handles the user request instead of another JSP. The controller is implemented as a servlet. The following steps are executed when the user submits the request.

1. The controller servlets handles the user's request. (This means the hyperlink in the JSP should point to the controller servlet).
2. The controller servlet then instantiates appropriate JavaBeans based on the request parameters (and optionally also based on session attributes).
3. The controller servlet then by itself or through a controller helper communicates with the middle tier or directly to the the database to fetch the required data.

4. The controller sets the resultant JavaBeans (either same or new one) in one of the following contexts – request, session or application.

5. The controller then dispatches the request to the next view based on the request URL.

6. The view uses the resultant JavaBeans from step 4 to display data. Note that there is no presentation logic in the JSP. The sole function of the JSP in Model 2 architecture is to display the data from the JavaBeans set in the request, session or application scope.

SDLC METHODOLOGIES

This document plays a vital role in the development of life cycle (SDLC) as it describes the complete requirement of the system. It means for use by developers and will be the basic during testing phase. Any changes made to the requirements in the future will have to go through formal change approval process.

SPRIRAL MODEL was defined by Barry Boehm in his 1988 article, “A Spiral Model of Software Development and Enhancement. This model was not the first model to discuss iterative development, but it was the first model to explain why the iteration models.

As originally envisioned, the iterations were typically 6 months to 2 years long. Each phase starts with a design goal and ends with a client reviewing the progress thus far. Analysis and engineering efforts are applied at each phase of the project, with an eye toward the end goal of the project.

The steps for Spiral Model can be generalized as follows:

- The new system requirements are defined in as much details as possible. This usually involves interviewing a number of users representing all the external or internal users and other aspects of the existing system.
- A preliminary design is created for the new system.
- A first prototype of the new system is constructed from the preliminary design. This is usually a scaled-down system, and

represents an approximation of the characteristics of the final product.

- A second prototype is evolved by a fourfold procedure:
 - o Evaluating the first prototype in terms of its strengths, weakness, and risks.
 - o Defining the requirements of the second prototype.
 - o Planning and designing the second prototype.
 - o Constructing and testing the second prototype.
- At the customer option, the entire project can be aborted if the risk is deemed too great. Risk factors might involved development cost over runs, operating-cost miscalculation, or any other factor that could, in the customer's judgment, result in a less than satisfactory final product.
- The existing prototype is evaluated in the same manner as was the previous prototype, and if necessary, another prototype is developed from it according to the four-fold procedure outlined above.
- The preceding steps are iterated until the customer is satisfied that the refined prototype represents the final product desired.
- The final system is constructed, based on the refined prototype.

IMPLEMENTATIONS

Hardware/Software Interface:

This section lists the minimum hardware and software requirements needed to run the system efficiently.

Hardware Interface:

- ❖ Intel Processor
- ❖ 10 GB of free hard-drive space
- ❖ 4 GB of RAM

Software Interface:

- ❖ Operating System: Vista/Linux/Windows7 or above
- ❖ Web Browser: IE 10 or above, Mozilla FF 31 and above or Google Chrome
- ❖ Programming Language: Java 1.8 OR Java 8
- ❖ Web Application: JDBC, Servlets, JSP
- ❖ Database: MYSQL Server 5.7.24
- ❖ Integrated Development Environment (IDE): NetBeans 11.3
- ❖ Server Deployment: Apache Tomcat 9.0

DATA FLOW DIAGRAMS

A graphical tool used to describe and analyze the movement of data through a system manual or automated including the process, stores of data, and delays in the system. Data flow diagrams are the central tool and the basis from which other components are developed. The transformation of data from input to output, through processes, may be described logically and independently of the physical components associated with the system. The DFD is also known as a data flow graph or a bubble chart.

DFD's are the model of the proposed system. They clearly should show the requirements on which the new system should be built. Later during design activity this is taken as the basis for drawing the system's structure charts. The basic notation used to create a DFD's are as follows:

Dataflow: Data move in a specific direction from an origin to a destination.

Process: People, procedures, or devices that use or produce (Transform) data. The physical component is not identified.

Source: External sources or destination of data, which may be people, programs, organizations or other entities.

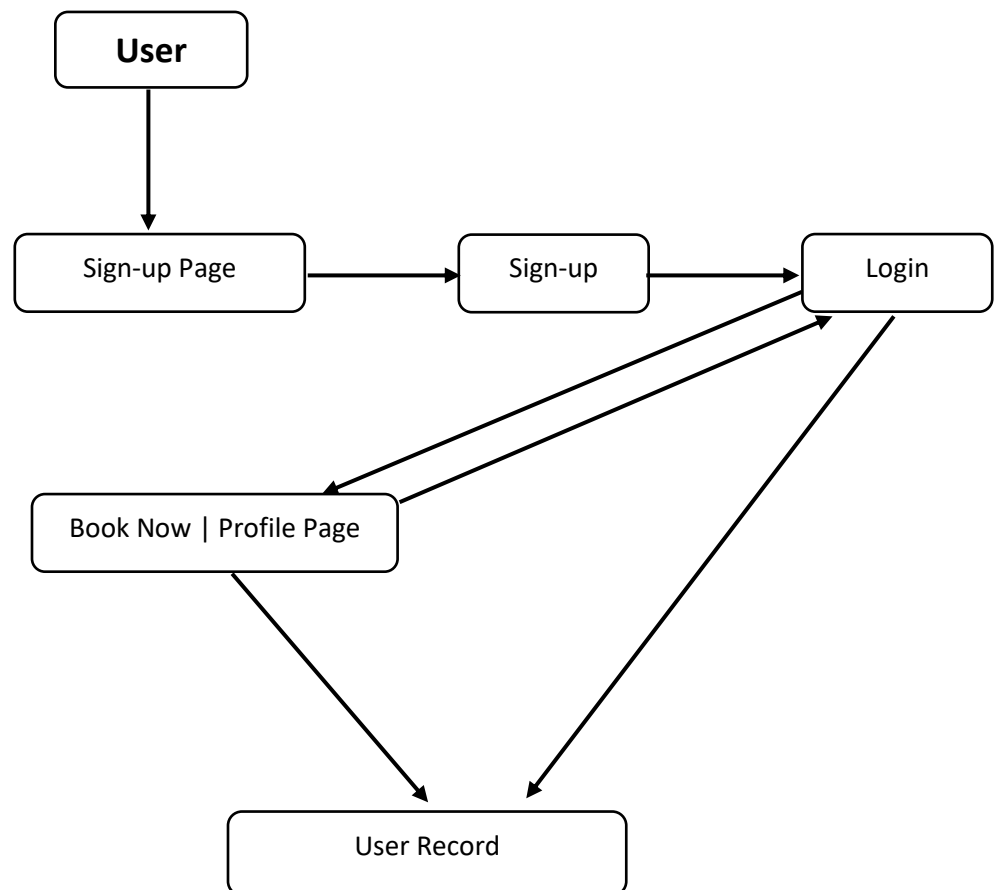

A simple rectangular box with a blue border, representing a data source in a diagram.

Data Store: Here data are stored or referenced by a process in the system.

A rectangular box with a blue border, divided into two sections by a vertical line. The left section is smaller than the right section, representing a data store in a diagram.

DATA FLOW DIAGRAM(DFD)

User travel system data flow diagram is often used as preliminary step to create an overview of the user cabs booking process. It contains all of the user flow and their entities such as user signup, user location, etc.

ER DIAGRAM OF USER TRAVEL SYSTEM

An entity-relationship model describes interrelated things of interest in a specific domain of knowledge. A basic ER modal is composed of entity type and specifies relationship.

WEBPAGE SCREENSHOT

The screenshot shows the TRAVEL website homepage. The header includes the TRAVEL logo, navigation links for Company, Feature, and Support, and user options for Log in, Sign up, and a Book Now button. The main banner features a woman wearing a face mask and a white sleeveless top, standing next to a car. Overlaid on the banner is a search form with tabs for CITY TEXTY, OUTSTATION, and RENTAL. The form contains fields for PICKUP (Current ride location), DROP (Enter drop location), and WHEN (Now), along with a Search Cabs button. The Windows taskbar at the bottom shows the date as 6/29/2022 and the time as 8:48 AM.

A car for every occasion

Ola offers city taxis, inter-city cabs, and local cabs at hourly packages

CITY TEXTY

The perfect way to get through your everyday travel needs. City taxis are available 24/7 and you can book and travel in an instant. With rides starting from as low as Rs. 6/km, you can choose from a wide range of options! you can

OUTSTATION

Ride out of town at affordable one-way and round-trip fares with Travel's intercity travel service. Choose from a range of AC cabs driven by top partners, available in 1 hour or book upto 7 days in advance. We have you covered

RENTAL

With Travel you get a cab at your disposal. So be it a day long business meeting, a shopping trip with your friends or just a day out in a new city, we have you covered. Packages start at 1 hour and can be extended upto 12 hours! . This

Why ride with Travel?

The best way to travel to your destination

Cabs for Every Pocket
From Sedans and SUVs to Luxury cars for special occasions, we have cabs to suit every pocket

Secure and Safer Rides
Verified drivers, an emergency alert button, and live ride tracking are some of the features that we have in place to ensure you a safe travel experience.

travel Select
A membership program with Ola that lets you ride a Prime Sedan at Mini fares, book cabs without peak pricing and has zero wait time

In Cab Entertainment
Play music, watch videos and a lot more with Ola Play! Also stay connected even if you are travelling through poor network areas with our free wifi facility.

Share and Express
To travel with the lowest fares choose Ola Share. For a faster travel experience we have Share Express on some fixed routes with zero deviations. Choose your ride and zoom away!

Cashless Rides
Now go cashless and travel easy. Simply recharge your Ola money or add your credit/debit card to enjoy hassle free payments

FUTURE ENHANCEMENT

Limitation Of the System:

- Some browser less responsiveness.
- Advance techniques are not used to check the authentication.
- It cannot keep track of a visitor leaves the site.

Future Enhancements:

It is not possible to develop a system that makes all the requirements of the user. User requirements keep changing as the system is being used. Some of the future enhancement that can be done to this system are:

CONCLUSION

WORK DONE

This website are successfully designed and tested for accuracy and quality. During this project we have accomplished all the objectives and this project meets the needs of the user travel. The developed will be used in searching, retrieving and generating information for concerned requests.

Goals:

- Reduced entry work.
- Easy retrieval of information.
- Reduced errors due to human intervention.
- User friendly screens to enter the data.
- Portable and flexible for further enhancement.
- Web enabled.

Fast finding of information requested
